Bystronic

Give wings to your laser cutting machine

The **ByTrans Modular** is a loading and unloading system that offers your Bystronic laser cutting machine a whole range of possibilities and layouts to meet your automation needs for both large series and small job batches.

High productivity thanks to automation

Automation tailored to customer requirements: The new ByTrans Modular offers a high degree of configurability in order to achieve short cycle times on your laser cutting system as well, thus increasing overall productivity and reducing the workload of your operators. A further plus point: The automated management of the unloading of large parts as well as the possibility of recovering the remaining sheet.

Easier operation thanks to new software

New software functions allow the control to be automated from the laser touch screen, but for larger systems, additional panels can be connected. The included remote assistance feature will ensure a closer link to the Bystronic world.

Seamless connection to other systems

The new system architecture allows a native connection to Bystronic next generation storage solutions. To achieve a further increase in productivity, the system is also prepared for connection to BySort. It is also possible to use your ByTrans Modular system to manage other laser cutting systems within the same automation.
